**MANIPAL**

*(A constituent unit of MAHE, Manipal)*

**JUNE 2021**

I dedicate my thesis to my friends and family.

## DECLARATION

I hereby declare that this project work entitled **Title of your project** is original and has been carried out by me in the Department of Information and Communication Technology of Manipal Institute of Technology, Manipal, under the guidance of **your guide name, Guide's designation**, Department of Information and Communication Technology, M. I. T., Manipal. No part of this work has been submitted for the award of a degree or diploma either to this University or to any other Universities.

Place: Manipal

Date :DD-MM-YY

Name1

Name2

**MANIPAL INSTITUTE OF TECHNOLOGY**  
**MANIPAL**  
*(A constituent unit of MAHE, Manipal)*

## **CERTIFICATE**

This is to certify that this project entitled **Your Project Title** is a bonafide project work done by **Mr. ABC (Reg.No.:160911xxx)** at Manipal Institute of Technology, Manipal, independently under my guidance and supervision for the award of the Degree of Bachelor of Technology in Information Technology.

Dr.XYZ

Designation of guide

Department of I & CT

Manipal Institute of Technology

Manipal, India

Dr.Smitha N Pai

Professor & Head

Department of I & CT

Manipal Institute of Technology

Manipal, India

## Company Certificate

please attach the completion certificate obtained by the company in the letter head signed by the mentor/authorized person from the company. Please ensure that the duration with starting and ending date are specified in the certificate along with the title of the project.

NOTE: NOT applicable to the students interning at Dept./MIT .

## ACKNOWLEDGEMENTS

Students may acknowledge the internal guide, external guide/mentor, project coordinator, HOD, Director etc.

# ABSTRACT

The abstract is brief synopsis of the project work and should be written in 3 paragraphs. The first paragraph should introduce the area of the topic and give importance of the work / topic in the present day scenario, hence leading to the objective of the project work. The second paragraph may discuss briefly about the design/ methodology that was adopted in addition to the tools used. The third paragraph should discuss briefly the important results that were obtained and its significance. You may also discuss about the important conclusion(s) of the project work. (The abstract should fit in one page only)

**[Security and Privacy]:** Cryptography—key management, symmetric cryptography; Security Services—authentication, access control

## Introduction

### 1.1 Introduction

The HUMAN population is continually expanding, as is the demand for food. According to UN projections[1,] the human population will reach 9.7 billion in 2050, up from the present estimate of 7.2 billion. Given that the majority of population growth (about 8030 years) occurs in least developed nations, where food shortage is a major issue, reducing food waste in these countries should be a primary goal. Global yield losses are projected to range from 20detection methods necessitate hand inspection of plants by professionals. This method must be continuing and pricey for large farms, or it may be utterly out of reach for many small farmers in rural areas. As a result, in recent decades, many initiatives to automate sickness detection have been made. Hyperspectral images are one of the most effective methods. Hyperspectral images are used to monitor broad areas and are often captured by satellite or aerial imaging equipment. This technique has several drawbacks, including a high cost of equipment, high dimensionality, and a small number of samples, all of which make it unsuitable for machine learning analysis (ML). Because of recent advances in computer vision and the availability of affordable hardware, RGB image analytics are currently the most often utilised technique. Another reason to look at RGB

photos is that, because to the widespread usage of cellphones, these solutions can reach even the most remote locations. Traditional machine learning (ML) methodologies or the deep learning (DL) method can be used to analyse RGB photos. Image pre-processing and attribute extraction are used in traditional methods, which are then fed into one of the machine learning algorithms. Support vector machines (SVM), k-nearest neighbours (k-NN) and full connected neural networks (FCNN), decision trees, and random forests are all popular techniques. For image classification problems, researchers have turned nearly totally to DL techniques in recent years. Classic approaches almost always outperform when a small dataset is provided, and they can be used without the usage of hand-made features. In this study, we compare the DL approach to established ML algorithms for plant disease categorization.

## 1.2 Motivation

Shortcomings in the previous work / referenced paper, Brief importance of the work in the present context, Significance of the possible end result etc.

## 1.3 Objectives

## 1.4 Organization of Report

Organization of the project report (chapter wise)

Figure 1.1: Learning how to learn

# Chapter 2

## Literature Survey

- Fungicide sprays, disease-specific chemical treatments, and vector management, for example, could give early indications of crop health and pesticide disease identification. This could aid in illness prevention and increased production. In this paper, the writers investigate, analyse, and acknowledge the need for a rapid, cost-effective, and reliable agricultural-progress monitoring sensor. They looked at current technologies like as spectroscopic and imaging methods, as well as volaceous profiling approaches to plant disease detection, in order to design ground-based sensors for monitoring plant health and disease in the field.
- A method for diagnosing image processing sickness was established after a thorough analysis of the authors' findings, which included double-stranded ribonucleic acid investigations, nucleic acid testing, and microscopy, among other plant diagnostic instruments.
- At the moment, computer vision is being utilised to identify plant diseases in a variety of ways. One method for identifying illnesses is to employ colour extraction services supplied by writers. In this study, the YcbCr, HSI, and CIELB colour models were successfully employed to recognise noise from a variety of sources, including camera flashes.

- The method for generating characteristics could be utilised to detect plant diseases. In recent tests, Patil and Bodhe used a threshold segmentation approach to estimate the area of sugarcane leaves and its triangular threshold for lesion zones, with an average accuracy of 98.60 percent.
- The texture extraction feature can be used to diagnose plant issues. Patil and Kumar created a method for detecting plant disease that uses textures such as inertia, homogeneity, and correlation to construct the images gray-level cooccurrence pattern.
- In maize leaves, they combined disease detection with colour extraction. All of these factors come together to produce a potent set of traits for improving image and classification quality. Some of the most frequent traditional character extraction methods were discussed by the authors. Due to the rapid rise of artificial intelligence research, the study focuses on the implementation of these approaches and strategies (AI).
- To recognise species of leaves, plagues, or illnesses, different neural network back- feed propagation algorithms use one input, one output, and a hidden layer. The authors recommended this model.
- A pest and disease control software model for agricultural crops has been developed.
- The researchers also use a new method for determining the location of damaged cotton leaves that enhances system accuracy by 95 percent. The forward-looking neural network and the particular swarm optimization (PSO) are used to demonstrate this.
- Vector Machine Support can also detect and differentiate between various plant ailments. This approach is used to diagnose sugar beet diseases,

and it has a success rate of 65 to 90 percent, depending on the kind and stage of the disease.

- Other methods that combine feature extraction and the Network Ensemble can be used to diagnose plant diseases (NNE). NNE generalises learning skills more broadly through training and the integration of a number of neural networks. Because of its 91 percent accuracy, this approach was widely utilised to diagnose tea leaf problems.

In biology, bioinformatics, biomedicine, robotics, and 3D technologies, among other fields of study, the authors have offered in-depth learning approaches to handle some of the most difficult topics. This work applies deep learning techniques for plant disease diagnostics by inventing and executing deep learning methodology. According to a thorough analysis of the most recent literature, the researchers did not study a comprehensive approach of evaluating leaf photos to diagnose plant ailments. The next parts go through our deep CNN recognition technique.

# Chapter 3

## Design and Methodology

### 3.1 System Analysis

#### 3.1.1 What is a Waterfall Model?

The Waterfall Model is a phase-by-phase method for partitioning software development. Each step of the SDLC is designed to be used for specialised tasks. Winston Royce was the first to debut it in 1970.

#### 3.1.2 Requirements:

The first stage entails determining what needs to be created, as well as the function and purpose of the structure. The specs of the product, as well as its

Devices	Requirements
Processor	Any Updated Processor
RAM	Min 4GB
Hard Disk	Min 100 GB

Table 3.1: Hardware Requirements

Type	System
Operating System	Any Updated Processor
Technology	Python3.6
IDE	PyCharm
Front End	PyQt5
Operating System	Windows

Table 3.2: Software Requirements

inputs and outputs, are checked and reported here.

### 3.1.3 System design

This step evaluates the requirements from the first phase and creates the system design. The system design aids in the selection of hardware and software, as well as the overall system architecture. The software code for the next level is currently being written.

### 3.1.4 Implementation

The system is built up of smaller programmes called devices, each with its own set of system design inputs, which are then integrated in the following phase. Unit testing is the process of creating and testing each unit's functionality.

### 3.1.5 Inclusion and Testing

All of the units developed during the implementation phase are incorporated into the system after each item has been tested. To uncover any problems or challenges, the application must be tested on a regular basis. Tests are conducted to ensure that the consumer has no difficulties installing the programme.

### **3.1.6 Deployment of the System**

The product is deployed or supplied to the customer once functional and non-functional testing is completed.

After the system or component has been installed, changes are needed to improve or boost performance. These changes could be made in response to client requests or as a consequence of issues that arise while the system is in use. Ongoing software support and maintenance are offered to the customer.

## **3.2 Rights of Functioning**

- Login as an Administrator
- Add a photo to your profile
- Detecting Plant Disease
- Precognition
- Training and Education
- Image Analysis
- Results of the Image

## **3.3 Non-Functional Requirements**

### **3.3.1 What is Non Functional Requirement?**

NON-FUNCTIONAL REQUIREMENT (NFR) is a quality indicator for software systems. They evaluate the software system's responsiveness, usability, security, portability, and other features, all of which are crucial to its success. A non-functional request would be, "How fast does the site charge?" Systems that do not meet user requirements may arise if non-functional criteria are

not used. Non-functional criteria can be used to constrain or limit the design of a system across multiple agile backlogs. If the number of visitors to the site exceeds 10,000, the website should load in three seconds. Non-functional needs are just as significant as functional requirements.

### **3.3.2 Examples of Non Functional Requirements**

1. After the first successful login, users must update the previously set login password. In addition, the beginning must never be repeated.
2. Employees demanded that their pay information be updated. The security administrator should be notified about this attempt.
3. For each unsuccessful user attempt to access the data item, an audit trail is kept.
4. A website should be able to track the activity of 20 million people at the same time.
5. Is software portability required? As a result, switching between operating systems isn't a problem.
6. Information confidentiality, technological export limits, intellectual property rights, and other issues should all be looked into.

### **3.3.3 Benefits of Non Functional Requirements**

- They offer a fantastic user experience and straightforward software deployment.
- They assist in the development of a software security policy.

### 3.3.4 Drawbacks of Non Functional Requirements

- The high-quality software subsystems are unaffected by any functional requirement.
- Extra attention is necessary throughout the software architecture / high-level design phase, which increases costs.
- When they're implemented, they normally don't result in the establishment of a new software subsystem.
- It's difficult to change non-functional items after the architectural phase is finished.

## 3.4 Implementation

The original data set was increased offline to create this data set. The original dataset is included in this project. This dataset contains roughly 87K pictures of healthy and damaged crop leaves divided into 38 classifications. To preserve the directory's structure, the complete data set is split into 80/20 training and validation ratios. A fresh directory with 33 test images will be released later.

Convolution covnets, or computational neural networks, are neural networks with shared parameters.

Layers are classified as follows:

1. The input layer
2. Convolutional Layer
3. The Layers' Activation
4. The layer of a swimming pool
5. A layer that is completely connected

Figure 3.1: CNN Layer

The image's raw input is stored on this layer, which has a width of 32 pixels, a height of 32 pixels, and a depth of three pixels. The output volume is computed by computing the dot product between all filters and the image patch in the convolution layer. This layer's output volume will be  $32 \times 32 \times 12$  if we use a total of 12 filters.

This layer will apply an element-by-element activation function to the output of the convolution layer. Frequent activation functions include RELU:  $\max(0, x)$ , Sigmoid:  $\frac{1}{1 + e^{-x}}$ , Tanh, Leaky RELU, and others.

## 3.5 SOFTWARE OVERVIEW

### 3.5.1 History of Python

Guido van Rossum worked on Python in the Netherlands' National Research Institute for Mathematics and Computers in the late 1980s and early 1990s. Python is based on ABC, Modula-3, C, C++, Algol-68, SmallTalk, Unix, and other languages. Python is a free and open-source programming language.

Python source code is now available under the GNU General Public License, just like Perl (GPL). Despite the fact that the Institute's core development team now utilises Python, Guido van Rossum remains instrumental in his development.

### 3.5.2 Input as CSV File

The ability to read CSV data is essential in the field of data science. We routinely acquire data from a variety of sources and convert it to CSV format so that it may be used by other systems. The Panadas library provides routines for reading a CSV file in its entirety as well as in segments for a single column and row group. The CSV file is a text file with commas between the values of columns. Examine the information in the input.csv file. The data can be copied and pasted into Windows Notepad to produce this file. Using Notepad's Save As All Files (\*.\*) option, save the file as input.csv.

```
import pandas as pd
data = pd.read_csv("path/input.csv")
print (data)
```

### 3.5.3 Operations using Numpy

Python is a programming language. The NumPy package stands for 'Numerical Python'. It's a collection of multidimensional array objects and algorithms for handling them. The developer can use NumPy to perform the following tasks.

- Array operations
- Shape algorithms are transformed and manipulated using Fourier transforms.

- Algebraic operations in linear form. NumPy has built-in random number generators and linear algebra functions.

### **3.5.4 Key Features of Pandas**

- DataFrame objects are quick and efficient because to adjustable indexing and a default.
- Tools for importing data into RAM data objects from a variety of file types.
- Data synchronisation and integrated data management
- You may pivot and modify your date settings.
- Labeling, indexing, and sub-setting large data sets
- The columns in the data structure can be removed or added.
- Data is grouped via aggregation and transformation.
- Data combining and combining with high performance.
- Time Series is a useful tool

# Chapter 4

## Chapter Title

### 4.1 abvvv

discuss about the results obtained, you may include sample screenshots of the results obtained

# **Chapter 5**

## **Student Contribution**

This chapter should include Individual contribution of each student. Applicable to GROUP PROJECTS ONLY.

### **5.1 Contribution of Student 1**

Minimum of 2 pages

### **5.2 Contribution of Student 2**

Minimum of 2 pages

# Chapter 6

## Conclusion and Future Scope

### 6.1 vvvvvv

This chapter should include

- Brief summary of the work - Problem statement / objective, in brief,  
Work methodology adopted, in brief
- Conclusions - General conclusions, Significance of the results obtained
- Future scope of work.

```

## B.2 Replay Attack overcome using Freshness

### Concept

```
-- specification AG !(agA.count < agB.count) is true
-- specification AG !(agI.state = receive4beta) is true
```

Dear [REDACTED]

Congratulations! We are pleased to offer you the position of “**Student Trainee**” at Samsung R&D Institute, Bangalore, from **6 January 2020** to **19 June 2020**.

**Stipend and Benefits:**

1. You will be entitled to a stipend of **INR. [REDACTED]** per month.
2. You are eligible to use the company transport (to and from the company) and cafeteria free of cost.
3. You will be covered under the **Group Personal Accident Insurance Policy** (as per the company policy).

Please bring a copy of all your testimonials along with the originals for verification on the date of joining.
